
The New Wave of Regionalism

Edward D. Mansfield and Helen V. Milner

Introduction

Economic regionalism appears to be growing rapidly. Why this has occurred and what bearing it will have on the global economy are issues that have generated considerable interest and disagreement. Some observers fear that regional economic institutions—such as the European Union (EU), the North American Free Trade Agreement (NAFTA), Mercosur, and the organization of Asia-Pacific Economic Cooperation (APEC)—will erode the multilateral system that has guided economic relations since the end of World War II, promoting protectionism and conflict. Others argue that regional institutions will foster economic openness and bolster the multilateral system. This debate has stimulated a large and influential body of research by economists on regionalism's welfare implications.

Economic studies, however, generally place little emphasis on the political conditions that shape regionalism. Lately, many scholars have acknowledged the drawbacks of such approaches and have contributed to a burgeoning literature that sheds new light on how political factors guide the formation of regional institutions and their economic effects. Our purpose is to evaluate this recent literature.

Much of the existing research on regionalism centers on international trade (although efforts have also been made to analyze currency markets, capital flows, and other facets of international economic relations).¹ Various recent studies indicate that whether states choose to enter regional trade arrangements and the economic effects of these arrangements depend on the preferences of national policymakers and interest groups, as well as the nature and strength of domestic institutions. Other studies focus on international politics, emphasizing how power relations and multilateral

For helpful comments on earlier drafts of this article, we are grateful to David Baldwin, Peter Gourevitch, Stephan Haggard, Peter J. Katzenstein, David A. Lake, Randall L. Schweller, Beth V. Yarbrough, and three anonymous reviewers. In conducting this research, Mansfield was assisted by a grant from the Ohio State University Office of Research and by the Hoover Institution at Stanford University, where he was a National Fellow during 1998–99.

institutions affect the formation of regional institutions, the particular states composing them, and their welfare implications. We argue that these analyses provide key insights into regionalism's causes and consequences. They also demonstrate the risks associated with ignoring its political underpinnings. At the same time, however, recent research leaves various important theoretical and empirical issues unresolved, including which political factors bear most heavily on regionalism and the nature of their effects.

The resolution of these issues is likely to help clarify whether the new "wave" of regionalism will be benign or malign.² The contemporary spread of regional trade arrangements is not without historical precedent. Such arrangements promoted commercial openness during the nineteenth century, but they also contributed to economic instability throughout the era between World Wars I and II. Underlying many debates about regionalism is whether the current wave will have a benign cast, like the wave that arose during the nineteenth century, or a malign cast, like the one that emerged during the interwar period. Here, we argue that the political conditions surrounding the contemporary episode augur well for avoiding many of regionalism's more pernicious effects, although additional research on this topic is sorely needed.

We structure our analysis around four central questions. First, what constitutes a region and how should regionalism be defined? Second, why has the pervasiveness of regional trade arrangements waxed and waned over time? Third, why do countries pursue regional trade strategies, instead of relying solely on unilateral or multilateral ones; and what determines their choice of partners in regional arrangements? Fourth, what are the political and economic consequences of commercial regionalism?

Regionalism: An Elusive Concept

Extensive scholarly interest in regionalism has yet to generate a widely accepted definition of it. Almost fifty years ago, Jacob Viner commented that "economists have claimed to find use in the concept of an 'economic region,' but it cannot be said that they have succeeded in finding a definition of it which would be of much aid . . . in deciding whether two or more territories were in the same economic region."³ Since then, neither economists nor political scientists have made much headway toward settling this matter.⁴

Disputes over the definition of an economic region and regionalism hinge on the importance of geographic proximity and on the relationship between economic flows and policy choices. A region is often defined as a group of countries located in the same geographically specified area. Exactly which areas constitute regions, however,

2. Bhagwati distinguishes two waves of regionalism since World War II. The first began in the late 1950s and lasted until the 1970s; the second began in the mid-1980s. These waves are discussed at greater length later in this article. See Bhagwati 1993.

3. Viner 1950, 123.

4. On this issue, see Katzenstein 1997a, 8–11.

remains controversial. Some observers, for example, consider Asia-Pacific a single region, others consider it an amalgamation of two regions, and still others consider it a combination of more than two regions. Furthermore, a region implies more than just close physical proximity among the constituent states. The United States and Russia, for instance, are rarely considered inhabitants of the same region, even though Russia's eastern coast is very close to Alaska. Besides proximity, many scholars insist that members of a common region also share cultural, economic, linguistic, or political ties.⁵ Reflecting this position, Kym Anderson and Hege Norheim note that "while there is no ideal definition [of a region], pragmatism would suggest basing the definition on the major continents and subdividing them somewhat according to a combination of cultural, language, religious, and stage-of-development criteria."⁶

Various studies, however, define regions largely in terms of these nongeographic criteria and place relatively little emphasis on physical location. For example, France and the Francophone countries of Northwest Africa are often referred to as a regional grouping because of their linguistic similarities. Also, social constructivists have argued that countries sharing a communal identity comprise a region, regardless of their location.⁷ In the latter vein, Peter J. Katzenstein maintains that regional "geographic designations are not 'real,' 'natural,' or 'essential.' They are socially constructed and politically contested and thus open to change."⁸ More common among scholars who define regions in nongeographic terms is a focus on preferential economic arrangements, which need not be composed of states in close proximity (for example, the United States–Israel Free Trade Area and the Lomé Convention).

Setting aside the issue of how a region should be defined, questions remain about whether regionalism pertains to the concentration of economic flows or to foreign policy coordination. Some analyses define regionalism as an *economic* process whereby economic *flows* grow more rapidly among a given group of states (in the same region) than between these states and those located elsewhere. An increase in intraregional flows may stem from economic forces, like a higher overall rate of growth within than outside the region, as well as from foreign economic policies that liberalize trade among the constituent states and discriminate against third parties.⁹

In a recent study, Albert Fishlow and Stephan Haggard sharply distinguish between regionalization, which refers to the regional concentration of economic flows, and regionalism, which they define as a *political* process characterized by economic *policy* cooperation and coordination among countries.¹⁰ Defined in this way, commercial regionalism has been driven largely by the formation and spread of preferential trading arrangements (PTAs). These arrangements furnish states with preferential access to members' markets (for example, the European Economic Community [EEC]/

5. See, for example, Deutsch et al. 1957; Nye 1971; Russett 1967; and Thompson 1973.

7. For example, Kupchan 1997.

8. Katzenstein 1997a, 7.

9. See, for example, Krugman 1991a; and Frankel, Stein, and Wei 1995. Of course, regionalism may stem from a combination of economic and political forces as well.

10. Fishlow and Haggard 1992. See also Haggard 1997, 48 fn. 1; and Yarbrough and Yarbrough 1997, 160 fn. 1.

European Community [EC]/European Union [EU], the European Free Trade Association [EFTA], NAFTA, and the Council for Mutual Economic Assistance [CMEA]); many of them also coordinate members' trade policies vis-à-vis third parties.¹¹ Among the various types of PTAs are customs unions, which eliminate internal trade barriers and impose a common external tariff (CET); free trade areas (FTAs), which eliminate internal trade barriers, but do not establish a CET; and common markets, which allow the free movement of factors of production and finished products across national borders.¹²

Since much of the contemporary literature on regionalism focuses on PTAs, we will emphasize them in the following analysis.¹³ Existing studies frequently consider PTAs as a group, rather than differentiating among the various types of these arrangements or distinguishing between bilateral arrangements and those composed of more than two parties. To cast our analysis as broadly as possible, we do so as well, although some of the institutional variations among PTAs will be addressed later in this article.

Economic Analyses of Regionalism

Much of the literature on regionalism focuses on the welfare implications of PTAs, both for members and the world as a whole. Developed primarily by economists, this research serves as a point of departure for the following analysis, so we now turn to a brief summary of it. Preferential trading arrangements have a two-sided quality, liberalizing commerce among members while discriminating against third parties.¹⁴ Since such arrangements rarely eliminate external trade barriers, economists consider them inferior to arrangements that liberalize trade worldwide. Just how inferior PTAs are hinges largely on whether they are trade creating or trade diverting, a distinction originally drawn by Viner. As he explained:

There will be commodities . . . for which one of the members of the customs union will now newly import from the other but which it formerly did not import at all because the price of the protected domestic product was lower than the price at any foreign source plus the duty. This shift in the locus of production as between the two countries is a shift from a high-cost to a low-cost point. . . . There will be other commodities which one of the members of the customs union will now newly import from the other whereas before the customs union it imported them from a third country, because that was the cheapest possible source

11. See, for example, Bhagwati 1993; Bhagwati and Panagariya 1996, 4–5; de Melo and Panagariya 1993; and Pomfret 1988.

12. See Anderson and Blackhurst 1993; and the sources in footnote 11, above.

13. In what follows, we refer to regional arrangements and PTAs interchangeably, which is consistent with much of the existing literature on regionalism.

14. As de Melo and Panagariya point out, “because under regionalism preferences are extended only to partners, it is discriminatory. At the same time it represents a move towards freer trade among partners.” de Melo and Panagariya 1993, 4.

of supply even after payment of the duty. The shift in the locus of production is now not as between the two member countries but as between a low-cost third country and the other, high-cost, member country.¹⁵

Viner demonstrated that a customs union's static welfare effects on members and the world as a whole depend on whether it creates more trade than it diverts. In his words, "Where the trade-creating force is predominant, one of the members at least must benefit, both may benefit, the two combined must have a net benefit, and the world at large benefits. . . . Where the trade-diverting effect is predominant, one at least of the member countries is bound to be injured, both may be injured, the two combined will suffer a net injury, and there will be injury to the outside world and to the world at large."¹⁶ Viner also demonstrated that it is very difficult to assess these effects on anything other than a case-by-case basis. Over the past fifty years, a wide variety of empirical efforts have been made to determine whether PTAs are trade creating or trade diverting. As we discuss later, there is widespread consensus that the preferential arrangements forged during the nineteenth century tended to be trade creating and that those established between World Wars I and II tended to be trade diverting; however, there is a striking lack of consensus on this score about the PTAs developed since World War II.¹⁷

Even if a PTA is trade diverting, it can nonetheless enhance the welfare of members by affecting their terms of trade and their capacity to realize economies of scale. Forming a PTA typically improves members' terms of trade vis-à-vis the rest of the world, since the arrangement almost always has more market power than any constituent party. At the same time, however, Paul Krugman points out that attempts by a PTA to exploit its market power may backfire if other such arrangements exist, since "the blocs may beggar each other. That is, formation of blocs can, in effect, set off a beggar-all trade war that leaves everyone worse off."¹⁸ He argues that these beggar-thy-neighbor effects are minimized when the number of trade blocs is either very large or very small.¹⁹ The existence of a single global bloc is equivalent to a free-trade system, which obviously promotes both national and global welfare. In a world composed of many small blocs, little trade diversion is expected because the optimal tariff for each bloc is quite low and the distortionary effect of a tariff imposed by any one is minimal. By contrast, Krugman claims that a system of three blocs can have an especially adverse impact on global welfare. Under these circumstances, each bloc has some market power, the potential flow of interbloc commerce is substantial, and trade barriers markedly distort such commerce.

15. Viner 1950, 43. For comprehensive overviews of the issues addressed in this section, see Baldwin and Venables 1995; Bhagwati 1991, chap. 5; Bhagwati and Panagariya 1996; Gunter 1989; Hine 1994; and Pomfret 1988.

16. Viner 1950, 44.

17. One reason for the lack of consensus on this issue is the dearth of reliable information about the degree to which price changes induce substitution across imports from different suppliers. Another reason is the difficulty associated with constructing counterfactuals (or "antimondes") that adequately gauge the effects of PTAs. On these issues, see Hine 1994; and Pomfret 1988, chap. 8.

18. Krugman 1991a, 16.

19. See *ibid.*; and Krugman 1993, 61.

Consistent with this proposition, a series of simulations by Jeffrey A. Frankel, Ernesto Stein, and Shang-Jin Wei reveal that world welfare is reduced when two or three PTAs exist, depending on the height of the external tariffs of each arrangement.²⁰ T. N. Srinivasan and Eric Bond and Constantinos Syropoulos, however, have criticized the assumptions underlying Krugman's analysis.²¹ In addition, various observers have argued that the static nature of his model limits its ability to explain how PTAs expand and the welfare implications of this process.²² These debates further reflect the difficulty that economists have had drawing generalizations about the welfare effects of PTAs. As one recent survey concludes, "analysis of the terms of trade effects has tended toward the same depressing ambiguity as the rest of customs union theory."²³

A regional trade arrangement can also influence the welfare of members by allowing firms to realize economies of scale. Over three decades ago, Jagdish Bhagwati, Charles A. Cooper and Benton F. Massell, and Harry Johnson found that states could reduce the costs of achieving any given level of import-competing industrialization by forming a PTA within which scale economies could be exploited and then discriminating against goods emanating from outside sources.²⁴ Indeed, this motivation contributed to the spate of PTAs established by less developed countries (LDCs) throughout the 1960s.²⁵ More recent studies have examined how scale economies within regional arrangements can foster greater specialization and competition and can shift the location of production among members.²⁶ Although these analyses indicate that PTAs could yield economic gains for members and adversely affect third parties, they also underscore regionalism's uncertain welfare implications.²⁷

Besides its static welfare effects, economists have devoted considerable attention to whether regionalism will accelerate or inhibit multilateral trade liberalization, an issue that Bhagwati refers to as "the dynamic time-path question."²⁸ Several strands of research suggest that regional economic arrangements might bolster multilateral openness. First, Murray C. Kemp and Henry Wan have demonstrated that it is possible for any group of countries to establish a PTA that does not degrade the welfare of either members or third parties, and that incentives exist for the union to expand until it includes all states (that is, until global free trade exists).²⁹ Second, Krugman and Lawrence H. Summers note that regional institutions reduce the number of actors engaged in multilateral negotiations, thereby muting problems of bargaining and collective action that can hamper such negotiations.³⁰ Third, there is a widespread

belief that regional trade arrangements can induce members to undertake and consolidate economic reforms and that these reforms are likely to promote multilateral openness.³¹

However, clear limits also exist on the ability of regional agreements to bolster multilateralism. Bhagwati, for example, maintains that although the Kemp-Wan theorem demonstrates that PTAs could expand until free trade exists, this result does not specify the likelihood of such expansion or that it will occur in a welfare-enhancing way.³² In addition, Bond and Syropoulos argue that the formation of customs unions may render multilateral trade liberalization more difficult by undercutting multilateral enforcement.³³ But Kyle Bagwell and Robert Staiger show that PTAs have contradictory effects on the global trading system. They claim that “the relative strengths of these . . . effects determine the impact of preferential agreement on the tariff structure under the multilateral agreement, and . . . preferential trade agreements can be either good or bad for multilateral tariff cooperation, depending on the parameters.”³⁴ They do conclude, however, that “it is precisely when the multilateral system is working poorly that preferential agreements can have their most desirable effects on the multilateral system.”³⁵

Economic analyses indicate that regionalism’s welfare implications have varied starkly over time and across PTAs. As Frankel and Wei conclude, “regionalism can, depending on the circumstances, be associated with either more or less general liberalization.”³⁶ In what follows, we argue that these circumstances involve political conditions that economic studies often neglect. Regionalism can also have important political consequences, and they, too, have been given short shrift in many economic studies. Lately, these issues have attracted growing interest, sparking a burgeoning literature on the political economy of regionalism. We assess this literature after conducting a brief overview of regionalism’s historical evolution.

Regionalism in Historical Perspective

Considerable interest has been expressed in how the preferential economic arrangements formed after World War II have affected and will subsequently influence the global economy. We focus primarily on this era as well; however, it is widely recognized that regionalism is not just a recent phenomenon. Analyses of the current spate of PTAs often draw on historical analogies to prior episodes of regionalism. Such analogies can be misleading because the political settings in which these episodes arose are quite different from the current setting. To develop this point, it is useful to

31. See, for example, Lawrence 1996; and Summers 1991.

32. Bhagwati 1991, 60–61; and 1993.

begin by describing each of the four waves of regionalism that have arisen over the past two centuries.

The initial episode occurred during the second half of the nineteenth century and was largely a European phenomenon.³⁷ Throughout this period, intra-European trade both rose dramatically and constituted a vast portion of global commerce.³⁸ Moreover, economic integration became sufficiently extensive that, by the turn of the twentieth century, Europe had begun to function as a single market in many respects.³⁹ The industrial revolution and technological advances attendant to it that facilitated interstate commerce clearly had pronounced effects on European integration; but so did the creation of various customs unions and bilateral trade agreements. Besides the well-known German Zollverein, the Austrian states established a customs union in 1850, as did Switzerland in 1848, Denmark in 1853, and Italy in the 1860s. The latter coincided with Italian statehood, not an atypical impetus to the initiation of a PTA in the nineteenth century. In addition, various groups of nation-states forged customs unions, including Sweden and Norway and Moldavia and Wallachia.⁴⁰

The development of a broad network of bilateral commercial agreements also contributed to the growth of regionalism in Europe. Precipitated by the Anglo-French commercial treaty of 1860, they were linked by unconditional most-favored-nation (MFN) clauses and created the bedrock of the international economic system until the depression in the late nineteenth century.⁴¹ Furthermore, the desire by states outside this commercial network to gain greater access to the markets of participants stimulated its rapid spread. As of the first decade of the twentieth century, Great Britain had concluded bilateral arrangements with forty-six states, Germany had done so with thirty countries, and France had done so with more than twenty states.⁴² These arrangements contributed heavily to the unprecedented growth of European integration and to the relatively open international commercial system that characterized the latter half of the nineteenth century, underpinning what Douglas A. Irwin refers to as an era of “progressive bilateralism.”⁴³

World War I disrupted the growth of regional trade arrangements. But a second wave of regionalism, which had a decidedly more discriminatory cast than its predecessor, began soon after the war ended. The regional arrangements formed between

37. See, for example, Kindleberger 1975; and Pollard 1974. However, regionalism was not confined solely to Europe during this era. Prior to 1880, for example, India, China, and Great Britain comprised a “tightly-knit trading bloc” in Asia. Afterward, Japan’s economic development and its increasing political power led to key changes in intra-Asian trade patterns. Kenwood and Lougheed report that “Asia replaced Europe and the United States as the main source of Japanese imports, supplying almost one-half of these needs by 1913. By that date Asia had also become Japan’s leading regional export market.” Kenwood and Lougheed 1971, 94–95.

38. Pollard 1974, 42–51, 62–66.

39. Kindleberger 1975; and Pollard 1974. Of course, trade grew rapidly worldwide during this era, but the extent of its growth and of economic integration was especially marked in Europe.

40. See Irwin 1993, 92; and Pollard 1974, 118.

41. See, for example, Irwin 1993; Kenwood and Lougheed 1971; and Pollard 1974.

42. Irwin 1993, 97.

43. *Ibid.*, 114. See also Pollard 1974, 35.

World Wars I and II tended to be highly preferential. Some were created to consolidate the empires of major powers, including the customs union France formed with members of its empire in 1928 and the Commonwealth system of preferences established by Great Britain in 1932.⁴⁴ Most, however, were formed among sovereign states. For example, Hungary, Romania, Yugoslavia, and Bulgaria each negotiated tariff preferences on their agricultural trade with various European countries. The Rome Agreement of 1934 led to the establishment of a PTA involving Italy, Austria, and Hungary. Belgium, Denmark, Finland, Luxembourg, the Netherlands, Norway, and Sweden concluded a series of economic agreements throughout the 1930s. Germany also initiated various bilateral trade blocs during this era. Outside of Europe, the United States forged almost two dozen bilateral commercial agreements during the mid-1930s, many of which involved Latin American countries.⁴⁵

Longstanding and unresolved debates exist about whether regionalism deepened the economic depression of the interwar period and contributed to political tensions culminating in World War II.⁴⁶ Contrasting this era with that prior to World War I, Irwin presents the conventional view: “In the nineteenth century, a network of treaties containing the most favored nation (MFN) clause spurred major tariff reductions in Europe and around the world, [ushering] in a harmonious period of multilateral free trade that compares favorably with . . . the recent GATT era. In the interwar period, by contrast, discriminatory trade blocs and protectionist bilateral arrangements contributed to the severe contraction of world trade that accompanied the Great Depression.”⁴⁷ The latter wave of regionalism is often associated with the pursuit of beggar-thy-neighbor policies and substantial trade diversion, as well as heightened political conflict.

Scholars frequently attribute the rise of regionalism during the interwar period to states’ inability to arrive at multilateral solutions to economic problems. As A. G. Kenwood and A. L. Loughheed note, “The failure to achieve international agreement on matters of trade and finance in the early 1930s led many nations to consider the alternative possibility of trade liberalizing agreements on a regional basis.”⁴⁸ In part, this failure can be traced to political rivalries among the major powers and the use of regional trade strategies by these countries for mercantilist purposes.⁴⁹ Hence, although regionalism was not new, both the political context in which it arose and its consequences were quite different than before World War I.

44. Pollard 1974, 145.

45. On the commercial arrangements discussed in this paragraph, see Condliffe 1940, chaps. 8–9; Hirschman [1945] 1980; Kenwood and Loughheed 1971, 211–19; and Pollard 1974, 49. Although our focus is on commercial regionalism, it should be noted that the interwar era was also marked by the existence of at least five currency regions. For an analysis of the political economy of currency regions, see, for example, Cohen 1997.

46. See, for example, Condliffe 1940, especially chaps. 8–9; Hirschman [1945] 1980; Kindleberger 1973; and Oye 1992.

47. Irwin 1993, 91. He notes that these generalizations are somewhat inaccurate, as do Eichengreen and Frankel 1995. But both studies confirm that regionalism had different effects during the nineteenth century, the interwar period, and the present; and both view regionalism in the interwar period as most malign.

48. Kenwood and Loughheed 1971, 218.

49. See Condliffe 1940; Eichengreen and Frankel 1995, 97; and Hirschman [1945] 1980.

Regionalism Since World War II

Since World War II, states have continued to organize commerce on a regional basis, despite the existence of a multilateral economic framework. To analyze regionalism's contemporary growth, some studies have assessed whether trade flows are becoming increasingly concentrated within geographically specified areas. Others have addressed the extent to which PTAs shape trade flows and whether their influence is rising. Still others have examined whether the rates at which PTAs form and states join them have increased over time. In combination, these studies indicate that commercial regionalism has grown considerably over the past fifty years.

As shown in Table 1—which presents data used in three influential studies of regionalism—the regional concentration of trade flows generally has increased since the end of World War II.⁵⁰ Much of this overall tendency is attributable to rising trade within Western Europe—especially among parties to the EC—and within East Asia. Some evidence of an upward drift in intraregional commerce also exists within the Andean Pact, the Economic Community of West African States (ECOWAS), and between Australia and New Zealand, although outside of the former two groupings, intraregional trade flows have not grown much among developing countries.

One central reason why trade is so highly concentrated within many regions is that states located in close proximity often participate in the same PTA.⁵¹ That the effects of various PTAs on commerce have risen over time constitutes further evidence of regionalism's growth.⁵² As the data in Table 1 indicate, the influence of PTAs on trade flows has been far from uniform. Some PTAs, like the EC, seem to have had a profound effect, whereas others have had little impact.⁵³ But the data also indicate that, in general, trade flows have tended to increase over time among states that are members of a PTA and not merely located in the same geographic region, suggesting that policy choices are at least partly responsible for the rise of regionalism since World War II.

East Asia, however, is an interesting exception. Virtually no commercial agreements existed among East Asian countries prior to the mid-1990s, but rapid economic growth throughout the region contributed to a dramatic increase in intraregional trade flows.⁵⁴ In light of Asia's recent financial crisis, it will be interesting to see whether the process of regionalization continues. Severe economic recession

50. These define regionalism in somewhat different ways. Anderson and Norheim examine broad geographic areas, de Melo and Panagariya analyze PTAs, and Frankel, Stein, and Wei consider a combination of geographic zones and PTAs. See Anderson and Norheim 1993; de Melo and Panagariya 1993; and Frankel, Stein, and Wei 1995.

51. On the effects of PTAs on trade flows, see, for example, Aitken 1973; Frankel 1993; Frankel, Stein, and Wei 1995; Linnemann 1966; Mansfield and Bronson 1997; Tinbergen 1962; and Winters and Wang 1994.

52. See, for example, Aitken 1973; Frankel 1993; and Frankel, Stein, and Wei 1995.

53. Note, however, that some PTAs—especially Mercosur—have had a large effect on trade since 1990. Their effects are not captured in Table 1. We are grateful to Stephan Haggard for bringing this point to our attention.

54. See Anderson and Blackhurst 1993, 8; Frankel 1993; Frankel, Stein, and Wei 1995; and Saxonhouse 1993.

TABLE 1. *Intraregional trade flows during the post-World War II era*

<i>A. Intraregional trade divided by total trade of each region</i>						
<i>Region</i>	<i>1965</i>	<i>1970</i>	<i>1975</i>	<i>1980</i>	<i>1985</i>	<i>1990</i>

within Asia concurrent with robust growth in North America and Western Europe may redirect trade flows across regions. This case illustrates the need we described earlier to distinguish between policy-induced regionalism and that stemming primarily from economic forces. How important the Association of Southeast Asian Nations (ASEAN) and other policy initiatives are in directing commerce should become clearer as the economic crisis in Asia unfolds.

Also indicative of regionalism's growth are the increasing rates at which PTAs formed and states joined them throughout the post-World War II period.⁵⁵ Figure 1 reports the number of regional trading arrangements notified to the General Agreement on Tariffs and Trade (GATT) from 1948 to 1994. Clearly, the frequency of PTA formation has fluctuated. Few were established during the 1940s and 1950s, a surge in preferential agreements occurred in the 1960s and 1970s, and the incidence of PTA creation again trailed off in the 1980s.⁵⁶ But there has been a significant rise in such agreements during the 1990s; and more than 50 percent of all world commerce is currently conducted within PTAs.⁵⁷ Indeed, they have become so pervasive that all but a few parties to the World Trade Organization (WTO) now belong to at least one.⁵⁸

Regionalism, then, seems to have occurred in two waves during the post-World War II era. The first took place from the late 1950s through the 1970s and was marked by the establishment of the EEC, EFTA, the CMEA, and a plethora of regional trade blocs formed by developing countries. These arrangements were initiated against the backdrop of the Cold War, the rash of decolonization following World War II, and a multilateral commercial framework, all of which colored their economic and political effects. Various LDCs formed preferential arrangements to reduce their economic and political dependence on advanced industrial countries. Designed to discourage imports and encourage the development of indigenous industries, such arrangements fostered at least some trade diversion.⁵⁹ Moreover, many of them were beset by considerable conflict over how to distribute the costs and benefits stemming from regional integration, how to compensate distributional losers, and how to allocate industries among members.⁶⁰ Similarly, the CMEA represented an attempt by the Soviet Union to promote economic integration among its political allies, foster the development of local industries, and limit economic dependence on the West. Ultimately, it did little to enhance the welfare of participants.⁶¹ In contrast, the regional arrangements concluded among developed countries—especially those in Western Europe—are widely viewed as trade-creating institutions that also contributed to political cooperation.⁶²

FIGURE 1. *The number of preferential trading arrangements notified to the GATT, 1948-94.*

The most recent wave of regionalism has arisen in a different context than earlier episodes. It emerged in the wake of the Cold War's conclusion and the attendant changes in interstate power and security relations. Furthermore, the leading actor in the international system (the United States) is actively promoting and participating in the process. PTAs also have been used with increasing regularity to help prompt and consolidate economic and political reforms in prospective members, a rarity during prior eras. And unlike the interwar period, the most recent wave of regionalism has been accompanied by high levels of economic interdependence, a willingness by the major economic actors to mediate trade disputes, and a multilateral (that is, the GATT/WTO) framework that assists them in doing so and that helps to organize trade relations.⁶³ As Robert Z. Lawrence notes,

The forces driving the current developments differ radically from those driving previous waves of regionalism in this century. Unlike the episode of the 1930s, the current initiatives represent efforts to facilitate their members' participation in the world economy rather than their withdrawal from it. Unlike those in the 1950s and 1960s, the initiatives involving developing countries are part of a strategy to liberalize and open their economies to implement export- and foreign-investment-led policies rather than to promote import substitution.⁶⁴

64. Lawrence 1996, 6. On the differences between regionalism in the 1930s and in the contemporary era, see also Eichengreen and Frankel 1995; Oye 1992; and Pomfret 1988.

Our brief historical overview indicates that regionalism has been an enduring feature of the international political economy, but both its pervasiveness and cast have changed over time. We argue that domestic and international politics are central to explaining such variations as well as the origins and nature of the current wave of regionalism. In what follows, we present a series of political frameworks for addressing these issues and raise some avenues for further research.

Domestic Politics and Regionalism

Although it is frequently acknowledged that political factors shape regionalism, surprisingly few systematic attempts have been made to address which factors most fully determine why states choose to pursue regional trade strategies and the precise nature of their effects. Early efforts to analyze the political underpinnings of regionalism were heavily influenced by “neofunctionalism.”⁶⁵ Joseph S. Nye points out that “what these studies had in common was a focus on the ways in which increased transactions and contacts changed attitudes and transnational coalition opportunities, and the ways in which institutions helped to foster such interaction.”⁶⁶ Lately, elements of neofunctionalism have been revived, especially in research on European integration. Many such analyses conclude that increased economic flows among members of the EU have changed the preferences of domestic actors, leading them to press for policies and institutions that promote deeper integration.⁶⁷

Societal Factors

As neofunctional studies indicate, the preferences and political influence of domestic groups can affect why regional strategies are selected and their likely economic consequences. Regional trade agreements discriminate against third parties, yielding rents for certain domestic actors who may constitute a potent source of support for a PTA’s formation and maintenance.⁶⁸ Industries that could ward off competitors located in third parties or expand their share of international markets if they were covered by a PTA have obvious reasons to press for its establishment.⁶⁹ So do export-oriented industries that stand to benefit from the preferential access to foreign markets afforded by a PTA. In addition, though it is all but impossible to construct a PTA that would not adversely affect at least some politically potent sectors, it is often

65. See, for example, Deutsch et al. 1957; Haas 1958; and Nye 1971.

66. Nye 1988, 239.

67. For example, Sandholtz and Zysman argue that the 1992 project in Europe to “complete the internal market” resulted from a confluence of leadership by the European Commission and pressure from a transnational coalition of business in favor of a European market. Frieden advances a similar argument in explaining support for the European Monetary Union, stressing the salience of the preferences of European-oriented business and financial actors. Moravcsik also views the origins of European integration as residing in the pressures exerted by European firms and industries with an external orientation for the creation of a larger market. See Sandholtz and Zysman 1989; Frieden 1991; and Moravcsik 1998.

68. See Gunter 1989, 9; and Hirschman 1981.

69. For example, Haggard 1997.

possible to exclude them from the arrangement, a tack, for example, that led to “the European Economic Community’s exclusion of agriculture (and, in practice, steel and many other goods), the Caribbean Basin Initiative’s exclusion of sugar, and ASEAN’s exclusion of just about everything of interest.”⁷⁰

Regional trade strategies, therefore, hold some appeal for public officials who need to attract the support of both import-competing and export-oriented sectors. The domestic political viability of a prospective PTA, the extent to which it will create or divert trade, and the range of products it will cover hinge partly on the preferences of and the influence wielded by key sectors in each country as well as the particular set of countries that can be assembled to participate in it. Unfortunately, existing studies offer relatively few theoretical or empirical insights into these issues, although some recent progress has been made on this front.

Public officials must strike a balance between promoting a country’s aggregate economic welfare and accommodating interest groups whose support is needed to retain office. Gene M. Grossman and Elhanan Helpman argue that whether a country chooses to enter a regional trade agreement is determined by how much influence different interest groups exert and how much the government is concerned about voters’ welfare.⁷¹ They demonstrate that the political viability of a PTA often depends on the amount of discrimination it yields. Agreements that divert trade will benefit certain interest groups while creating costs borne by the populace at large. If these groups have more political clout than other segments of society, then a PTA that is trade diverting stands a better chance of being established than one that is trade creating.⁷² Grossman and Helpman also find that by excluding some sectors from a PTA, governments can increase the domestic support for it, thus helping to explain why many PTAs do not cover politically sensitive industries. Consistent with earlier research, their results imply that trade-diverting PTAs will face fewer political obstacles than trade-creating ones.⁷³ If so, using preferential arrangements as building blocks to support multilateral liberalization will require surmounting substantial domestic impediments.

Opinion is divided over the ease with which this can be accomplished. Kenneth A. Oye argues that discriminatory PTAs can actually lay the basis for promoting multilateral openness, especially if the international trading system is relatively closed.⁷⁴ In his view, discrimination stemming from a preferential arrangement can mobilize and strengthen the political hand of export-oriented (and other antiprotectionist) interests located in third parties, thereby generating domestic pressure in these states for agreements that expand their access to PTA members’ markets. Such agreements, in turn, are likely to contribute to international openness. However, Anne O. Krueger maintains that the formation and expansion of PTAs may dampen the support of exporters for broader liberalization. As she puts it, “For those exporters who would

71. Grossman and Helpman 1995, 668; and 1994.

72. Grossman and Helpman 1995, 681. See also Pomfret 1988, 190.

73. For example, Hirschman 1981, 271.

74. Oye 1992, 6–7, 143–44.

support free trade, the value of further multilateral trade liberalization is diminished with every new entrant into a preferential trade arrangement, so that exporters' support for multilateral liberalization is likely to diminish as vested interests profiting from trade diversion increase."⁷⁵ Hence, it is not clear whether exporters will support regionalism instead of or in addition to multilateral liberalization.

Equally unclear is why exporters would prefer to liberalize trade on a regional rather than a multilateral basis in the first place. One possibility is that exporters will be more likely to support regional strategies if they operate in industries characterized by economies of scale, since, by protecting these sectors from foreign competition and broadening their market access, the formation of a PTA can bolster their competitiveness. Indeed, Milner argues that firms in such industries may be key proponents of regional, rather than unilateral or multilateral, trade policies.⁷⁶ But because PTAs also liberalize trade among participants, firms with competitors in prospective member countries may seek to bar these states from entering an arrangement or oppose its establishment altogether.

Though research stressing the effects of societal factors on regionalism offers various useful insights, it also suffers from at least two drawbacks. First, there is a lack of empirical evidence indicating which domestic groups support regional trade agreements, whose interests these agreements serve, and why particular groups prefer regional to multilateral liberalization. For example, Oye maintains that discriminatory arrangements piqued the interest of exporters, and Milner claims that exporters—particularly those with large scale economies—may have favored and gained from NAFTA.⁷⁷ Neither, however, demonstrates that exporters preferred regional arrangements to multilateral ones. Regional liberalization may have been what they had to settle for given the existence of strong, opposing domestic interests. Second, we know little about whether, once in place, regional arrangements foster domestic support for broader, multilateral trade liberalization or whether they undermine such support. These issues offer promising avenues for future research.

Domestic Institutions

In the final analysis, the decision to enter a PTA is made by policymakers. Both their preferences and the nature of domestic institutions condition the influence of societal actors on trade policy as well as independently affecting whether states elect to embark on regional trade initiatives. Of course, policymakers and politically potent societal groups sometimes share an interest in forming a PTA. Many regional trade arrangements that LDCs established during the 1960s and 1970s, for instance, grew out of import-substitution policies that were actively promoted by policymakers and strongly supported by various segments of society.⁷⁸

75. Krueger 1997, 19 fn. 27.

76. Milner 1997. See also Busch and Milner 1994.

77. See Milner 1997; and Oye 1992.

78. See, for example, Krueger 1993, 77, 87; and Nogués and Quintanilla 1993, 280–88.

However, PTAs also have been created by policymakers who preferred to liberalize trade but faced domestic obstacles to doing so unilaterally. In this vein, Barry Eichengreen and Jeffrey A. Frankel point out that “Columbia and Venezuela decided in November 1991 to turn the previously moribund Andean Pact into what is now one of the world’s most successful FTAs. Policymakers in these countries explain their decision as a politically easy way to dismantle protectionist barriers to an extent that their domestic legislatures would never have allowed had the policy not been pursued in a regional context.”⁷⁹ Even if influential domestic actors oppose commercial liberalization altogether, institutional factors sometimes create opportunities for policymakers to sidestep such opposition by relying on regional or bilateral trade strategies. Consider the situation Napoleon III faced on the eve of the Anglo-French commercial arrangement. Anxious to liberalize trade with Great Britain, he encountered a French legislature and various salient domestic groups that were highly protectionist. But although the legislature had considerable control over unilateral trade policy, the constitution of 1851 permitted the emperor to sign international treaties without this body’s approval. Napoleon, therefore, was able to skirt well-organized protectionist interests much more easily by concluding a bilateral commercial agreement that would have been impossible had he relied solely on unilateral instruments.⁸⁰

Similarly, governments that propose a program of liberal economic reforms and encounter (or expect to encounter) domestic opposition may enter a PTA to bind themselves to these changes.⁸¹ Mexico’s decision to enter NAFTA, for example, is frequently discussed in such terms. As one recent study concludes, “NAFTA should be understood as a commitment device . . . , [which] combined with the influence of new elites that benefit from export promotion, greatly increases the likelihood that trade liberalization in Mexico will not be derailed.”⁸² For a state that is interested in making liberal economic reforms, the attractiveness of locking them in through an external mechanism, such as joining a PTA, is likely to grow if influential segments of society oppose reforms and if domestic institutions render policymakers especially susceptible to societal pressures. Under these conditions, however, governments must have the institutional means to circumvent domestic opposition in order to enter such agreements, and the costs of violating a PTA must be high enough to ensure that reforms will not be abrogated.

Although governments may choose to join regional agreements to promote domestic reforms, they may also do so if they resist reforms but are anxious to reap the benefits stemming from preferential access to other members’ markets. Existing members of a preferential grouping may be able to influence the domestic economic

79. Eichengreen and Frankel 1995, 101.

80. See Irwin 1993, 96; and Kindleberger 1975, 39–40. Moreover, this is not an isolated case. Irwin notes that “Commercial agreements in the form of foreign treaties proved useful in circumventing protectionist interests in the legislature throughout Europe.” Irwin 1993, 116 fn. 7.

81. See de Melo, Panagariya, and Rodrik 1993; Haggard 1997; Summers 1991; and Whalley 1998.

82. Tornell and Esquivel 1997, 54. See also Whalley 1998, 71–72. That this arrangement helped to consolidate Mexican economic reforms probably heightened its desirability from the standpoint of the United States and Canada as well. See, for example, Eichengreen and Frankel 1995, 101.

policies and the political institutions of prospective members by demanding that they institute domestic reforms prior to accession. Along these lines, there are various cases where PTAs have made the establishment of democracy a necessary condition for membership. Both Spain and Portugal were required to complete democratic transitions before being admitted to the EC; indeed, L. Alan Winters argues that solidifying democracy in these states as well as in Greece was a chief reason for the EC's southern expansion.⁸³ Similarly, Argentina and Brazil insisted that a democratic system of government would have to be established in Paraguay before it could enter Mercosur.⁸⁴ More recently, the EU has indicated that various Eastern European countries must consolidate democratic reforms as one precondition for membership. As Raquel Fernández mentions, "Both the EU and the CEE [Central East European] countries wanted to lock in a political commitment to democracy in the CEE countries; since the promise of eventual EU membership implied in the Agreements . . . was conditional on the continued democratization of the CEE countries, the cost of exit to these countries as a consequence of reversion to authoritarianism would not just be the loss of benefits, if any, of the Agreements, but the loss of the prospect of EU membership."⁸⁵ Another study echoes this view, noting that a key motive behind any future eastward expansion of the EU would be fostering democracy in the former members of the Warsaw Pact.⁸⁶ Clearly, we are not suggesting that the desire to gain access to a PTA has been a primary force driving democratization in Eastern Europe or elsewhere. However, recent experience suggests that it can sometimes be fruitful to include such access in a package of inducements designed to spur political reform in nondemocratic states.

Using PTA membership to stimulate liberal economic and political reforms is a distinctive feature of the latest wave of regionalism. That these reforms have been designed to open markets and promote democracy may help to account for the relatively benign character of the current wave. Underlying demands for democratic reform are fears that admitting nondemocratic countries might undermine existing PTAs composed of democracies and the belief that regions composed of stable democracies are unlikely to experience hostilities. Both views remain open to question. But if entering a preferential arrangement actually promotes the consolidation of liberal economic and political reforms and mutes the economic and political instability that often accompanies such reforms, then the contemporary rise of regionalism may contribute to both commercial openness and political cooperation.⁸⁷

At the same time, the political viability of such PTAs, the credibility of the institutional changes they prompt, and the effect of these arrangements on international openness and cooperation depend heavily on the preferences of powerful domestic groups. Whereas domestic analyses of regionalism have generally focused on either

83. Winters 1993, 213.

84. Birch 1996, 186.

85. Fernández 1997, 26.

86. Eichengreen and Frankel 1995, 103.

87. On these issues, see Haggard and Kaufman 1995; Haggard and Webb 1994; Lawrence 1996; Mansfield and Snyder 1995; and Remmer 1998.

societal or institutional factors, more attention needs to be centered on how the interaction between these factors influences whether and when countries enter a regional arrangement as well as on the political and economic consequences of doing so.⁸⁸ Greater attention also needs to be focused on why state leaders have displayed a particular preference for entering regional trade arrangements. One possibility is that they do so to liberalize trade when faced with domestic obstacles to reducing trade barriers on a unilateral or multilateral basis. Theories outlining the conditions under which leaders prefer to liberalize commerce in the first place, however, remain scarce.

Furthermore, the extent to which PTAs have been used as instruments for stimulating economic and political liberalization during the current wave of regionalism is quite unusual by historical standards. Chile, for example, withdrew from the Andean Pact in 1976 because it wanted to complete a series of economic reforms that this arrangement prohibited.⁸⁹ Moreover, attempts to spur democratization in prospective PTA members are largely unique to the contemporary wave. As noted earlier, the recent tendency of existing PTAs to demand that nondemocratic states complete political reforms prior to accession probably reflects the growing number of preferential arrangements composed of democracies and the widely held belief by policymakers in these regional groupings that fostering democracy will promote peace and prosperity. Nonetheless, we lack a sufficient theoretical understanding of the conditions under which PTA membership is used to prompt liberalizing reforms and the factors affecting the success of such efforts.

A related line of research suggests that the similarity of states' political institutions influences whether they will form a preferential arrangement and its efficacy once established. Many scholars view a region as implying substantial institutional homogeneity among the constituent states. Likewise, some observers maintain that the feasibility of creating a regional agreement depends on prospective members having relatively similar economic or political institutions.⁹⁰ If trade liberalization requires harmonization in a broad sense, such as in the Single European Act, then the more homogeneous are members' national institutions, the easier it may be for them to agree on common regional policies and institutions. Others point out that countries in close geographic proximity have much less impetus to establish regional arrangements if their political institutions differ significantly. In Asia, for example, the scarcity of regional trade arrangements is partly attributable to the wide variation in the constituent states' political regimes, which range from democracies like Japan to autocracies like Vietnam and China.⁹¹

As the initial differences in states' institutions become more pronounced, so do both the potential gains from and the impediments to concluding a regional agreement. Consequently, the degree of institutional similarity among states and the prospect that membership in a regional arrangement will precipitate institutional change

88. For one study of this sort, see de Melo, Panagariya, and Rodrik 1993.

89. Nogués and Quintanilla 1993, 285.

90. For example, *ibid.*

91. Katzenstein 1997a.

in these states may bear heavily on whether they form a PTA.⁹² The extant literature, however, provides little guidance about how large institutional differences can be before regional integration becomes politically infeasible. Nor does it indicate whether regional agreements can help members to lock in institutional reforms if there is little preexisting domestic support for these changes.

International Politics and Regionalism

The decision to form a PTA rests partly on the preferences and political power of various segments of society, the interests of state leaders, and the nature of domestic institutions. In the preceding section, we suggested some ways that these factors might operate separately and in combination to influence whether states pursue regional trade strategies and regionalism's economic consequences. But states do not make the decision to enter a PTA in an international political vacuum. On the contrary, interstate power and security relations as well as multilateral institutions have played key roles in shaping regionalism. Equally important is how regionalism affects patterns of conflict and cooperation among states. We now turn to these issues.

Political Power, Interstate Conflict, and Regionalism

Studies addressing the links between structural power and regionalism have placed primary stress on the effects of hegemony. Various scholars argue that international economic stability is a collective good, suboptimal amounts of which will be provided without a stable hegemon.⁹³ Discriminatory trade arrangements, in turn, may be outgrowths of the economic instability fostered by the lack or decline of such a country.⁹⁴ Offering one explanation for the trade-diverting character of PTAs during the interwar period, this argument is also invoked by many economists who maintain that the current wave of regionalism was triggered or accelerated by the U.S. decision to pursue regional arrangements in the early 1980s, once its economic power waned and multilateral trade negotiations stalled.⁹⁵ In fact, there is evidence that over the past fifty years the erosion of U.S. hegemony has stimulated a rise in the number of PTAs and states entering them.⁹⁶ But why waning hegemony has been associated with the growth of regionalism since World War II, what effects PTAs formed in response to declining hegemony will have on the multilateral trading system, and whether variations in hegemony contributed to earlier episodes of regionalism are issues that remain unresolved.⁹⁷

92. For example, Hurrell 1995, 68–71.

93. See Gilpin 1975; Kindleberger 1973; and Lake 1988.

94. See, for example, Gilpin 1975 and 1987; Kindleberger 1973; and Krasner 1976.

95. See, for example, Baldwin 1993; Bhagwati 1993; Bhagwati and Panagariya 1996; Krugman 1993; and Pomfret 1988.

96. Mansfield 1998.

97. See, for example, McKeown 1991; Oye 1992; and Yarbrough and Yarbrough 1992.

Some observers argue that as a hegemon's power recedes, it has reason to behave in an increasingly predatory manner.⁹⁸ To buffer the effects of such behavior, other states might form a series of preferential trading blocs, thereby setting off a wave of regionalism. Robert Gilpin suggests that this sort of process began to unfold during the 1980s, giving rise to a system of loose regional economic blocs that is coalescing around Western Europe, the United States, and Japan. He also points out that because of the inherent problems of "pluralist" leadership, these developments threaten the unity of the global trading order, a prospect that recalls Krugman's claims about the adverse effects on global welfare stemming from systems composed of three trade blocs.⁹⁹ The extent to which U.S. hegemony has actually declined and whether such a system is actually emerging, however, remain the subjects of fierce disagreement.

Furthermore, even if such a system is emerging, there are at least two reasons why the situation may be less dire than the preceding account would indicate. First, despite the potential problems of pluralist leadership, it is widely argued that global openness can be maintained in the face of declining (or the absence of) hegemony if a small group of leading countries collaborates to support the trading system.¹⁰⁰ The erosion of U.S. hegemony may have stimulated the creation and expansion of PTAs by a set of leading economic powers that felt these arrangements would assist them in managing the international economy.¹⁰¹ Drawing smaller states into preferential groupings with a relatively liberal cast toward third parties might reduce the capacity of these states to establish a series of more protectionist blocs and bind them to decisions about the system made by the leading powers. Especially if there is a multilateral framework (like the GATT/WTO) to which each leading power (including the declining hegemon) is committed and that can help to facilitate economic cooperation, the growth of regionalism during periods of hegemonic decline could contribute to the maintenance of an open trading system.

Second, Krugman argues that the dangers posed by a system of three trade blocs are muted if each bloc is composed of countries in close proximity that conduct a high volume of commerce prior to its establishment. Both he and Summers conclude that these "natural" trading blocs reduce the risk of trade diversion and that they make up a large portion of the existing PTAs.¹⁰² Regardless of this argument's merits,

98. For example, Gilpin 1987, 88–90, and chap. 10.

99. See *ibid.*; and Krugman 1991a and 1993. On the problems associated with pluralist leadership, see also Kindleberger 1973.

100. See, for example, Keohane 1984; and Snidal 1985.

101. On this issue, see Yarbrough and Yarbrough 1992.

102. Krugman 1991a and 1993; and Summers 1991. Of course, these factors may be related, since an inverse relationship tends to exist between transportation costs and trade flows. However, some strands of this argument focus on high levels of trade, which may be a product of geographical proximity, whereas others focus on transportation costs, which are expected to be lower for states in the same region than for other states. See Bhagwati and Panagariya 1996, 7 fn. 7. Wonnacott and Lutz, who first coined the term "natural trading partners," argue that the economic development of states, the extent to which their economies are complementary, and the degree to which they compete in international markets also influence whether trading partners are natural. These factors, however, have received relatively little attention and we therefore do not examine them here. See Wonnacott and Lutz 1989.

which have been hotly debated by economists,¹⁰³ it begs an important set of questions: Why do some “natural” trade partners form PTAs while others do not? And why do some “unnatural” partners do so as well? There is ample reason to expect that the answers to these questions hinge largely on domestic political factors and the nature of political relations between states.

Central to the links between international political relations and the formation of PTAs are the effects of trade on states’ political-military power.¹⁰⁴ Joanne Gowa points out that the efficiency gains from open trade promote the growth of national income, which can be used to enhance states’ political-military capacity.¹⁰⁵ Countries cannot ignore the security externalities stemming from commerce without jeopardizing their political well-being. She maintains that countries can attend to these externalities by trading more freely with their political-military allies than with other states. Since PTAs liberalize trade among members, Gowa’s argument suggests that such arrangements are especially likely to form among allies. In PTAs composed of allies, the gains from liberalizing trade among members bolster the alliance’s overall political-military capacity, and the common security aims of members attenuate the political risks that states benefiting less from the arrangement might otherwise face from those benefiting more.

Returning to the claims advanced by Krugman and Summers, certain blocs (for example, those in North America and Western Europe), therefore, may appear natural partly because they are composed of allies, which tend to be located in close proximity and to trade heavily with each other.¹⁰⁶ Furthermore, allies may be quite willing to form PTAs that divert trade from adversaries lying outside the arrangement, if they anticipate that doing so will impose greater economic damage on their foes than on themselves. In the same vein, adversaries have few political reasons to form a PTA, and allies that establish one are unlikely to permit their adversaries to join, thus limiting the scope for the expansion of preferential arrangements. Either situation could undermine the security of members, since some participants are likely to derive greater economic benefits than others even if all of them realize absolute gains in welfare. It is no coincidence, for instance, that preferential agreements between the EC/EU and EFTA, on the one hand, and various states formerly in the Soviet orbit, on the other, were concluded only after the end of the Cold War and the

103. Bhagwati and Panagariya, for example, have lodged several criticisms against it. First, there are no clear empirical standards for gauging whether a given pair of trade partners is natural. Second, they challenge the assumption that high trade volumes among natural trade partners imply that low trade volumes exist among “unnatural” partners, thereby limiting the scope for trade diversion. Third, a high initial level of trade between states need not emanate from economic complementarities; instead, it might stem from preexisting patterns of discrimination. If so, these states may not be natural trade partners, and any PTA they establish may not be trade creating. See Bhagwati 1993, 34–35; and Bhagwati and Panagariya 1996.

collapse of the Warsaw Pact.¹⁰⁷ Also, although deep political divisions continue to exist in various parts of the world, the lack of competing major power alliances may help to account for the relatively benign economic cast of the latest wave of regionalism.

Another way that regional arrangements can affect power relations is by influencing the economic dependence of members. If states that derive the greatest economic gains from a PTA are more vulnerable to disruptions of commercial relations within the arrangement than other participants, the political leverage of the latter is likely to grow. This point has not been lost on state leaders.

Prussia, for example, established the Zollverein largely to increase its political influence over the weaker German states and to minimize Austrian influence in the region.¹⁰⁸ As a result, it repeatedly opposed Austria's entry into the Zollverein. Similarly, both Great Britain and Prussia objected to the formation of a proposed customs union between France and Belgium during the 1840s on the grounds that it would promote French power and undermine Belgian independence. As Viner points out, "Palmerston took the position that every union between two countries in commercial matters must necessarily tend to a community of action in the political field also, but that when such community is established between a great power and a small one, the will of the stronger must prevail, and the real and practical independence of the smaller country will be lost."¹⁰⁹ Furthermore, Albert O. Hirschman and others have described how various major powers used regional arrangements to bolster their political influence during the interwar period and how certain arrangements that seemed likely to bear heavily on the European balance of power (like the proposed Austro-German customs union) were actively opposed.¹¹⁰

Since World War II, stronger states have continued to use PTAs as a means to consolidate their political influence over weaker counterparts. The CMEA and the many arrangements that the EC established with former colonies of its members are cases in point. The Caribbean Basin Initiative launched by the United States in 1982 has been described in similar terms.¹¹¹ A related issue is raised by Joseph M. Grieco, who argues that, over the past fifty years, the extent of institutionalization in regional arrangements has been influenced by power relations among members.¹¹² In areas where the local distribution of capabilities has shifted or states have expected such a shift to occur, weaker states have opposed establishing a formal regional institution, fearing that it would reflect the interests of more powerful members and undermine their security. Another view, however, is that regional institutions foster stability and constrain the ability of members to exercise power. A recent study of the EU, for example, concludes that although Germany's power has enabled it to shape Euro-

pean institutions, Germany's entanglement within these institutions has taken the hard edge off its interstate bargaining and eroded its hegemony in Europe.¹¹³

The links between power relations and PTAs remain important in the contemporary era, although they have not been studied in sufficient depth. But in contrast to the interwar period, there is relatively little indication that regionalism has been the product of active attempts by states to promote their political-military power since World War II. Barry Buzan attributes this change to the emergence of bipolarity, the decline of empires, and the advent of nuclear weapons.¹¹⁴ The latest wave of regionalism has been marked by especially few instances of states using PTAs to bolster their political-military capacity. That is probably one reason why regionalism has done less to divert trade over the past fifty years than during the interwar period.¹¹⁵ It also may help to explain why PTA membership has inhibited armed conflict throughout the post-World War II era.¹¹⁶ Gilpin has distinguished between benign and malevolent strains of regionalism. On the one hand, regionalism can promote international economic stability, multilateral liberalization, and peace. On the other hand, it can have a mercantilist tenor, degrading economic welfare and fostering interstate conflict.¹¹⁷ The available evidence suggests that, from an international political standpoint, regionalism has been relatively benign since World War II, which may have dampened its potentially pernicious economic consequences.¹¹⁸

Power and security relations have influenced the formation and spread of PTAs. That such relations are also likely to affect the welfare implications of preferential arrangements poses a central challenge to the many economic studies that analyze regionalism in an international political vacuum. However, little contemporary research has directly addressed these topics. Moreover, the existing literature does not furnish an adequate understanding of how power and security relations have shaped regionalism over time; nor does it resolve questions about how recent changes in both regional and global politics have affected the rise and cast of the latest wave of PTAs.

Multilateral Institutions, Strategic Interaction, and Regionalism

One of the most distinctive features of the two waves of regionalism occurring since World War II is the multilateral framework in which they arose. Most contemporary PTAs have been established under the auspices of the GATT/WTO, which has at-

115. For an empirical analysis of trade creation and trade diversion covering these periods, see Eichengreen and Frankel 1995.

116. See, for example, Nye 1971; and Mansfield, Pevehouse, and Bearce forthcoming.

117. Gilpin 1975, 235.

118. At the same time, very little evidence has been accumulated on this score. Although a considerable amount of recent work has addressed the effects of trade flows on interstate conflict, far less attention has been paid to the influence of institutions (both regional and multilateral) designed to guide trade. For some earlier research bearing on the relationship between regional economic arrangements and conflict, see Haas 1958; and Nye 1971. For an overview of the literature on the relationship between trade flows and conflict, see McMillan 1997.

tempted to dampen trade diversion by limiting members' ability to discriminate against third parties.¹¹⁹ But the GATT's success in fostering trade-creating PTAs has been qualified. Many arrangements formed by its economically less-developed members have been highly protectionist, and even the extent to which those preferential groupings established among its developed members have been welfare enhancing is the subject of considerable dispute.

Furthermore, the absence of multilateral management has not always led to the formation of discriminatory regional arrangements. The liberal trading order of the nineteenth century was constructed on a bilateral and regional basis lacking any multilateral foundation. Also, Irwin points out that the economic and political damage caused by trade blocs formed in the 1930s might have been ameliorated if the League of Nations had not insisted on trying to promote the multilateral organization of commerce.¹²⁰ In the same vein, Oye argues that regionalism "preserved zones of openness" early in that decade and that decentralized and "discriminatory bargaining was an important force for liberalization" during its middle and end.¹²¹

Article XXIV of the GATT outlines the conditions under which states are permitted to establish regional integration arrangements. Its stipulation that PTAs eliminate internal trade barriers and its prohibition on increases in the average level of members' external tariffs do not preclude the possibility of trade diversion.¹²² But Eichengreen and Frankel note that the latter prohibition "explicitly rules out Krugman's concern" about a beggar-thy-neighbor trade war arising in systems composed of a few large PTAs.¹²³ To the extent that such a system has been emerging, the GATT/WTO, therefore, may have an important role to play in averting what could otherwise be a destructive wave of regionalism.

Provisions for forming PTAs were made at the time of the GATT's establishment because it was apparent that this body would be hard-pressed to forbid states from doing so. In addition, some decision makers seemed to believe that the provision in Article XXIV to completely eliminate trade barriers within PTAs would complement GATT initiatives to promote multilateral openness.¹²⁴ Indeed, parties to the GATT may have established PTAs at such a rapid rate during the past fifty years because they viewed regional liberalization as a stepping-stone to multilateral liberalization, a central premise of those who believe that preferential groupings will serve as building blocks to global openness. Alternatively, GATT members may have formed such arrangements to help offset progressively deeper cuts in protection made at the multilateral level and to protect uncompetitive sectors. A chief fear of those who view PTAs as stumbling blocks to multilateral liberalization is that arrangements formed for these reasons will divert trade and undermine future efforts at multilateral liberalization.

124. See Bhagwati 1993; and Finger 1993.

Besides attempting to regulate the formation of PTAs, the GATT has made efforts to manage strategic interdependence among them. Preferential arrangements have formed in reaction to one another throughout each wave of regionalism. During the nineteenth century, this tendency was prompted by states' desire to obtain access to MFN treatment. Doing so required them to enter the network of bilateral commercial arrangements undergirding the trading system, which generated increases in the number of these arrangements and countries that were party to one.¹²⁵ Throughout the interwar period, PTAs formed in reaction to each other due largely to mercantilist policies and political rivalries among the major powers.¹²⁶

Strategic interaction has continued to guide the development of PTAs since World War II.¹²⁷ It has been argued, for example, that EFTA was created in response to the EEC; the latter also spurred various groups of LCDs to form regional arrangements.¹²⁸ Furthermore, NAFTA has stimulated the establishment of bilateral economic arrangements in the Western Hemisphere and in the Asia-Pacific region as well as agreements to conclude others.¹²⁹ Yet contemporary PTAs have formed in reaction to each other for different reasons than before: GATT members have not established them to obtain MFN treatment, and they are not the products of mercantilist policies.

Among the explanations offered for this recent tendency is that a PTA's establishment can prompt fears by third parties that it will undermine their competitiveness, thereby inducing them to form a rival bloc. Similarly, a state entering an existing PTA may provoke concern on the part of its economic rivals that they will be placed at a competitive disadvantage in international markets, unless they respond in kind. Even if states are not economic rivals, the perception that a regional economic arrangement is benefiting members can lead other states that are anxious to reap similar gains to join a PTA.¹³⁰ In addition, PTAs might form and expand in reaction to one another because they usually have more aggregate market power and thus more bargaining power than their constituent members.¹³¹ Various Latin American countries, for example, established PTAs over the past decade to improve their leverage in negotiations with the United States and NAFTA. Likewise, the EEC's original members believed that its creation would enhance their bargaining power in negotiations with the United States, and participants in the Central European Free Trade Area

128. Pomfret 1988, 161, 178.

129. For example, Serra et al. 1997, 8–9. Also consistent with these views is evidence linking the depth of integration within PTAs to the establishment of competing economic blocs. For example, Bhagwati and Fernández suggest that heightened European integration contributed to the creation of NAFTA; and Oye and Sandholtz and Zysman point out that NAFTA's formation prompted additional integration within the EU. See Bhagwati 1991, 72; Fernández 1997, 16–19; Oye 1992, 164–65; and Sandholtz and Zysman 1989.

hoped its formation would bolster their ability to negotiate entrance into the EC/EU.¹³²

Although the growth of regional arrangements has been marked by a “contagion” effect throughout each wave we have analyzed, far less damage has accrued to the international trading system as a result during the post–World War II era than during the 1930s. Besides certain factors discussed earlier, the GATT helped to limit such damage by restricting (albeit with varying degrees of success) the ability of participants to form highly discriminatory trade blocs. Moreover, because there is little chance of creating a system composed of “open” bilateral agreements, like that which existed during the nineteenth century, the WTO’s capacity to manage the recent cascade of PTAs will continue to be an important determinant of regionalism’s cast. Just how important the GATT has been and the WTO will be is the topic of substantial disagreement. So is whether the proliferation of PTAs is placing increasing pressure on the WTO, an issue that has stimulated much of the recent research on regionalism.

A related set of issues pertain to whether the multilateral framework that has guided international economic relations since World War II has colored the effects of power relations on regionalism. Would the United States have behaved in a more predatory fashion and would PTAs consequently have a more discriminatory tenor if its economic decline had occurred outside a multilateral setting? To what extent has the GATT/WTO reduced the scope for trade diversion and conflict between PTAs by muting its members’ ability to use regional arrangements as mercantilist instruments? Answering these questions (and many others raised earlier) requires systematic empirical research on the links between international politics and regionalism that has been sorely lacking to date.

Variations Among Regional Institutions

Thus far, we have analyzed PTAs as a whole, without focusing on the differences among them. Yet it is clear that all regional trade institutions are neither created equal nor equally successful in meeting their stated objectives. Significant variations exist in both the institutional design of PTAs and the depth of integration they foster. A number of recent efforts have been made to assess the political causes and consequences of these differences.

The depth of integration within a PTA depends on economic factors, including members’ levels of economic development and the extent to which their economies are complementary.¹³³ It also hinges on many of the political factors that influence the formation of PTAs, as we have suggested throughout this article. But in addition, the institutional design of a regional arrangement affects the degree of integration among participants. For example, some observers argue that an inverse relationship

132. See Haggard 1997; and Whalley 1998, 72.

133. See Balassa 1961; Fischer 1993; Foroutan 1993; and Nogués and Quintanilla 1993.

exists between the number of parties to a PTA and the depth of economic integration within it. Deeper integration is more easily attained if states share an interest in economic liberalization; all else equal, the heterogeneity of members' preferences is likely to increase as the number of members grows.¹³⁴ For this reason and because of collective action problems, forming a small PTA is easier than forming a large one, regardless of the level of integration eventually attained.¹³⁵ Large, highly integrated PTAs can be established. However, rather than trying to do so from scratch, George W. Downs, David M. Rocke, and Peter N. Barsoom suggest that it is more effective to create a smaller PTA composed of states with a preference for liberalizing economic relations and then take on additional members incrementally—precisely the strategy the EC/EU has followed.¹³⁶

Another set of design features that differs across PTAs is the extent of the commercial preferences granted to members, whether they impose a CET, and whether the arrangement explicitly covers issue areas other than trade (for example, monetary relations and immigration and environmental policy). Economists have highlighted the welfare consequences of these institutional variations.¹³⁷ But such differences also have been linked to some of the political factors we discussed earlier, though the existing literature on these issues remains quite small. Bernard Hoekman and Michael Leidy, for example, argue that customs unions are likely to yield greater protection than FTAs.¹³⁸ Customs unions set a CET, and it may be easier for protectionist groups to ally across states to raise it than to forge an alliance to raise tariffs independently set by each member. In addition, parties to an FTA have an incentive to engage in competitive trade barrier reductions, since doing so will promote foreign investment and exports. Thus, many analysts argue that dynamic processes propel reductions in external tariffs under an FTA, whereas a customs union is likely to set its CET just high enough to protect its least-efficient members.¹³⁹

On the other hand, political factors may render customs unions preferable to FTAs and other preferential arrangements that do not impose a CET. Countries setting trade barriers collectively can dilute the political influence of protectionist interest groups in any given member. Both administrative costs and the level of protection may be higher in an FTA than in a customs union, since elaborate rules of origin and content requirements are necessary to enforce the former type of agreement.¹⁴⁰ Like

134. On this point, see de Melo, Panagariya, and Rodrik 1993; Downs, Rocke, and Barsoom 1998; and Haggard 1997.

135. See de Melo, Panagariya, and Rodrik 1993; and Olson 1993.

136. Downs, Rocke, and Barsoom 1998.

137. See, for example, de Melo, Panagariya, and Rodrik 1993, 171–75; and Frankel, Stein, and Wei 1995. One especially interesting finding is that, although eliminating trade barriers among members is likely to promote economic integration, less dramatic reductions of these barriers often are preferable on economic grounds.

138. Hoekman and Leidy 1993, 239.

139. See de Melo, Panagariya, and Rodrik 1993, 171–74; and Wonnacott 1996, 92–95.

140. As Wonnacott explains, “because an FTA allows each member to set its own tariff on outside countries, it requires rules of origin (ROOs). Otherwise, there would be an incentive for trade deflection—that is, imports would come into the FTA through the low-tariff country and be transhipped duty-free into the high-tariff country.” For discussions of why customs unions are more desirable than FTAs because ROOs in the latter tend to be protectionist, see Wonnacott 1996, 90–91; and Krueger 1995.

the formation of PTAs, more generally, both the domestic and the international political environment are likely to shape which type of arrangement states choose to form. How they do so has hardly been explored and is a fruitful avenue for further research.

A final design feature that varies among PTAs is their institutional density. Grieco maintains that the institutionalization of economic relations can be compared across three dimensions: (1) the locus of institutionalization, (2) the scope of activity, and (3) the level of institutional authority.¹⁴¹ Recently, scholars have expressed particular interest in why certain regions display a high degree of institutionalization (for example, Western Europe) but others do not (for example, Asia). One possibility stressed by economists and political scientists for decades—and widely criticized of late—is that more highly institutionalized arrangements arise as functional responses to intensified integration among the constituent states.¹⁴² Another possibility, suggested by Miles Kahler, is that the extent of institutionalization depends on the preferences of policymakers and interest groups as well as bargaining among PTA members.¹⁴³ Grieco advances a third possibility. As noted earlier, he argues that institutionalization will be forestalled when “less powerful countries in a region have experienced or are experiencing a significant deterioration in their relative capabilities” because of their concerns “that the enhancement of regional economic ties brought about by institutionalization [will] accentuate regional imbalances in capabilities even further in favor of the relatively stronger partners.”¹⁴⁴ In his view, for example, the weaker countries of Southeast Asia are likely to oppose the establishment of formal economic institutions, whereas the stronger powers, especially Japan, are likely to press for their development.

In contrast to Grieco’s argument, however, Katzenstein points out that “today it is China and Japan who oppose rapid moves toward a formal institutionalization of regional integration,” whereas weaker powers like the members of ASEAN seek stronger institutions.¹⁴⁵ Moreover, a wide variety of scholars attribute the lack of formal institutions in East Asia to factors other than local power relations. Peter A. Petri notes that “the development of regional institutions [in Asia] is complicated by both the great diversity of the region’s countries and by the preferences of many of the region’s countries for informal, negotiated (as opposed to formal, legalistic) approaches to policy.”¹⁴⁶ Haggard and Katzenstein emphasize Asia’s commitment to “open regionalism,” which implies a desire for nondiscriminatory trade practices and a willingness to accept new members, differing sharply from the more closed variety of regionalism that marks Europe and the Americas.¹⁴⁷ This commitment is often seen as a function of the high levels of economic, political, and cultural heterogeneity in Asia and the region’s relationship with the United States.

141. Grieco 1997.

143. *Ibid.*

144. Grieco 1997, 176.

145. Katzenstein 1997a, 23.

146. Petri 1993, 43.

147. See Haggard 1997; and Katzenstein 1997a.

Katzenstein proposes some additional reasons for the weak institutionalization of Asian economic relations.¹⁴⁸ First, after World War II the United States promoted the principles of bilateralism in Asia and multilateralism in Europe. Second, the construction of a collective identity facilitates the establishment of formal regional integration, and political actors in Asia have not subscribed to the idea of creating a distinct community. Finally, the distinctive character of Asian states hinders the creation of regional institutions. He maintains that the “network character” of these states, their emphasis on consensus building, and the convergence between public and private spheres in domestic politics differentiate them from European countries and render them less likely to develop formal regional institutions.

Although aspects of these institutional variations have been studied intensively, their international political and economic implications have received far less attention than is warranted. That there are economic gains from integration is obvious. But economists remain divided over whether partially reducing trade barriers within a PTA yields greater static benefits than completely eliminating them, and very little research has been conducted on the consequences of differences in the degree of liberalization within PTAs for the stability of the multilateral trading system. Moreover, while greater integration might inhibit hostilities among PTA members—for example, by raising the costs of disrupting trade relations—the effects of variations in integration on political conflict and cooperation have not been examined in sufficient depth.

The degree of regional institutionalization may bear on both issues. If different preferential groupings develop unique sets of rules and practices that are at odds with multilateral arrangements, then the liberal trading order could erode and commercial conflicts between PTAs could erupt. This prospect should not be dismissed out of hand, since countries sometimes prefer to organize economic relations on a regional rather than a multilateral basis precisely because it allows them to select an institutional design that meets their specific needs.¹⁴⁹ But it also should not be overstated. To date, there is little evidence that institutional differences among PTAs have contributed to significant commercial conflicts or substantially weakened the international trading system.

Conclusions

The recent proliferation of PTAs has spurred considerable interest in economic regionalism, but existing research has produced little consensus on its sources and implications. Efforts to resolve these issues have been hampered by disagreements about the definition of a region and of regionalism as well as cross-regional and intertemporal variations that limit how widely generalizations can be drawn. However, many such efforts have also been hindered by the widespread tendency to place little stress on

148. Katzenstein 1997a.

149. For example, Yarbrough and Yarbrough 1997.

the political underpinnings of regionalism. Over the past decade, there has been a growing recognition that the propensity of countries to enter PTAs, the pace of regionalism, and its welfare implications depend on political conditions. Although the burgeoning literature emerging on these topics has not established either which political factors are most important or the exact nature of their effects, it has established that analyses operating in a political vacuum risk arriving at misleading conclusions about the causes and consequences of regionalism.

What are some of the key findings arising from this research and the key questions that remain unresolved? First, existing work indicates that the preferences and political influence of different societal groups are likely to affect whether a state enters a PTA as well as which sectors are covered by the arrangement and whether it creates or diverts trade. Protectionist groups have an incentive to press for the establishment of PTAs that discriminate in their favor, and government officials that depend on protectionist interests for political support have an incentive to respond to such pressures. Export-oriented interests may also support entering a PTA, if doing so grants them expanded access to vital foreign markets within the bloc or reduces the prospect that their access to these markets will be disrupted in the future.

In practice, however, it may be difficult to construct PTAs that meet the demands of both import-competing and export-oriented interests in prospective members, thereby limiting the scope for their formation. Furthermore, though recent studies of regionalism emphasizing societal factors suggest that the economic cast of PTAs will depend heavily on the interests and political influence of groups in member states, the theoretical and empirical tools needed to make these assessments require refinement. More generally, this body of research has not yet resolved exactly which segments of society are most likely to support regional trade initiatives as opposed to unilateral or multilateral ones, whose interests these initiatives serve, and whether commercial regionalism heightens or undermines the support of various groups for multilateral liberalization.

Second, the preferences of government officials and the nature of domestic institutions influence the establishment and economic effects of PTAs. Of late, certain governments have opted to enter a PTA because doing so seemed likely to facilitate more extensive commercial liberalization than unilateral or multilateral strategies would permit, given the nature of domestic institutions and the interests of potent segments of society. In the same vein, the latest wave of regionalism has been marked by cases where accession to a PTA was used to facilitate liberal economic and political reforms and to dilute the political efficacy of societal groups that opposed such changes. But though the preferences of government officials and the nature of domestic institutions clearly have affected efforts at regional integration, precisely which institutional conditions promote regionalism has not been established. Nor have existing studies identified the conditions under which PTA membership is most likely to stimulate domestic reform. Equally important is the need to more fully integrate societal and statist models of regionalism. Most analyses of the relationship between domestic politics and regionalism have emphasized either societal or institutional factors. However, the effects of each factor on the establishment and economic impli-

cations of a PTA are likely to depend heavily on the other, an issue that has received little attention.

Third, both the formation of regional trade arrangements and their consequences hinge on international political conditions. Much recent interest has been expressed in whether declining U.S. hegemony has contributed to the latest wave of regionalism. Although the available evidence suggests that PTAs did become more pervasive as hegemony eroded, what underlies this relationship, how it bears on regionalism's welfare consequences, and whether receding hegemony affected prior episodes of regionalism remain matters of dispute. Less widely analyzed of late, but central to various earlier studies, are the links between PTAs and interstate power relations. Due to these effects, for example, states have greater incentives to enter PTAs with their allies than with their foes, which may help to explain why the Cold War's end and the attendant changes in international security relations have coincided with regionalism's growth during the past decade. Furthermore, during earlier eras, PTAs were often used by larger states to heighten the economic and political dependence of smaller countries and by groups of states to reduce their collective dependence on third parties. The rarity with which PTAs have been actively used for such mercantilist purposes during the contemporary wave of regionalism is noteworthy and warrants further attention.

Fourth, the period since World War II is the first to experience the growth of regionalism within the context of a multilateral trade system. All but a few members of the WTO currently belong to a PTA and it is centrally important to determine why its members often choose to pursue regional trade initiatives rather than relying solely on multilateral initiatives. One possibility is that they view PTAs as a complement to multilateral liberalization; another is that they view regional and multilateral liberalization as substitutes. This issue lies at the heart of contemporary debates about whether PTAs will be building blocks or stumbling blocks to greater multilateral openness, and existing research on the political economy of regionalism has done little to resolve it. Equally important are questions pertaining to what role the GATT/WTO has played in managing the spread of regionalism. There is fairly widespread agreement that the GATT/WTO has helped to limit the emergence of highly discriminatory blocs and to manage strategic interaction among PTAs. But exactly how important the GATT/WTO's role has been in these matters and whether PTAs would have been substantially more discriminatory in its absence are more contentious topics.

Fifth, important institutional differences exist among PTAs, including the number of members involved, the extent of the preferential treatment they grant members, whether they impose a CET, and their institutional density. Some analyses of these variations center on domestic factors, such as the prevailing character of policy networks at home and the preferences of interest groups and national policymakers. Others focus on international factors, including power relations, strategic interaction among members, and their political and economic relations with third parties. However, existing research on the political conditions shaping the design of regional institutions is largely suggestive. Moreover, the political consequences of different

institutional forms are surrounded more by debate than by theory or evidence. The political sources and effects of institutional variations across PTAs represent an understudied and especially fertile ground for future research.

In this article, we have outlined some of the ways that political factors have influenced the formation and effects of PTAs. The recent literature surveyed here offers some key insights into these relationships. The political underpinnings of regionalism, however, remain murky, and the need for additional research on this topic is glaring. Not only will such research produce a better understanding of regionalism, it is also likely to contribute to broader issues in the field of international relations, including the political economy of national security, the domestic and international sources of foreign economic policy, and the factors influencing the design and strength of international institutions.

One area we have not discussed but that merits greater attention is financial regionalism. As trade flows have increased over the postwar period, so have international capital flows. Although it is commonly accepted that international capital mobility has grown significantly, the extent of regionalism in financial markets is more controversial and less widely studied.¹⁵⁰ The relationship between financial and commercial regionalism is another understudied issue. The experience of the EU, where a common market preceded the creation of a single currency, suggests that the two might be tightly related.¹⁵¹ Additional work is needed to determine whether the same political factors that shape commercial regionalism also affect financial regionalism.

The current wave of regionalism has arisen in a different context than earlier ones. Unlike prior episodes, the most influential state in the global system (the United States) is actively promoting the formation of PTAs. Furthermore, the current wave has occurred in the face of the Cold War's conclusion and various accompanying changes in the international political system. So far, regional arrangements have seldom been used as instruments of power politics; instead, they have often been used to promote and consolidate domestic reforms that liberalize markets and foster democracy. And the pace of regionalism has accelerated during a period marked by substantial economic interdependence, a desire by countries to mediate trade disputes, and a multilateral framework that facilitates such mediation and the organization of commercial relations. In our view, this set of political conditions has contributed significantly to the relatively benign character of the current wave of regionalism.

There is a widespread belief that this current wave will persist. Far less consensus exists on whether it should be embraced. Many scholars and policymakers view regionalism as a stepping-stone to greater global openness, an outcome not without historical precedent: During the second half of the nineteenth century, an open international trading system was forged largely through bilateral agreements and owed little to multilateral cooperation.¹⁵² Various observers also view comparisons with the interwar period as being overdrawn. But fears that regionalism will strain the

150. See, for example, Frankel 1993; Eichengreen and Frankel 1995; and Cohen 1998.

151. For example, Milner 1997, 102.

152. For example, Irwin 1993, 91.

multilateral trading system are not without merit. We have discussed a number of domestic and international political reasons for the establishment of trade-diverting PTAs and identified some conditions under which such arrangements could limit systemic openness. Further research is therefore needed to identify the domestic and international political conditions under which regionalism's effects are most likely to be benign or pernicious. A more nuanced understanding of these issues will be especially important for policymakers as they try to prevent the current wave of regionalism from fragmenting the global economy.
